

# Getting started with Ansible

**Duration: 20 Minutes**

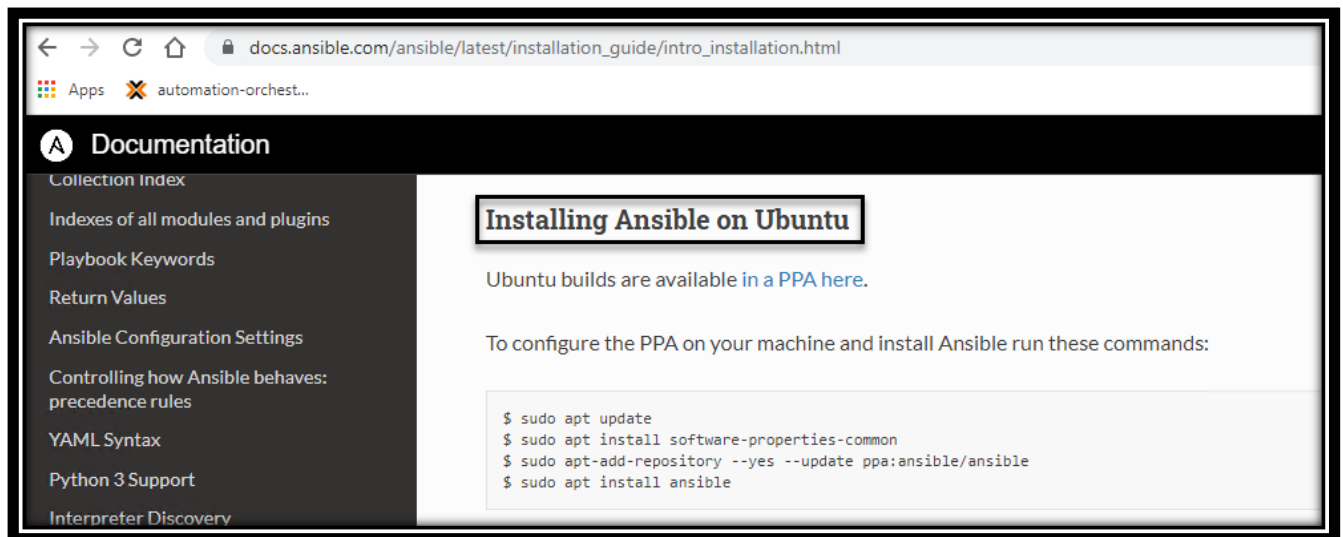

## Introduction

In this lab, we will install Ansible on our Orchestrator using the official Ansible documentation and run simple tests using ad-hoc commands.

## Exercise – 1: Installing Ansible

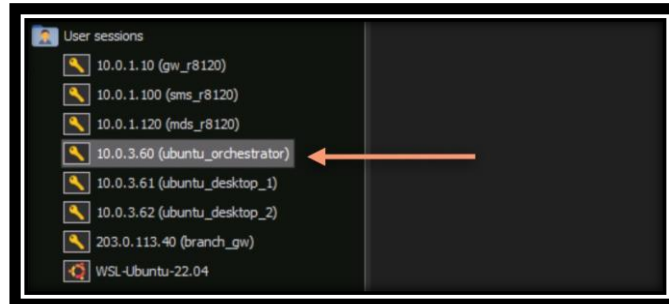

1. Review the official Ansible documentation portal and locate the commands to install Ansible on Ubuntu.

[https://docs.ansible.com/ansible/latest/installation\\_guide/intro\\_installation.html](https://docs.ansible.com/ansible/latest/installation_guide/intro_installation.html)

```
sudo apt update -y
sudo apt install software-properties-common -y
sudo apt-add-repository --yes --update ppa:ansible/ansible
sudo apt install ansible -y
```

2. Connect to the orchestrator using the bookmarked session in **MobaXterm** and use the commands above to install Ansible.

3. Use the command **ansible --version** to confirm that ansible is running. Notice the default “config” file location (It is also the **inventory** location).

```
admin@orchestrator:~$ ansible --version
ansible [core 2.15.6]
  config file = /etc/ansible/ansible.cfg
  configured module search path = ['/home/admin/.ansible/plugins/modules', '/usr/share/ansible/plugins/modules']
  ansible python module location = /usr/lib/python3/dist-packages/ansible
  ansible collection location = /home/admin/.ansible/collections:/usr/share/ansible/collections
  executable location = /usr/bin/ansible
  python version = 3.10.12 (main, Jun 11 2023, 05:26:28) [GCC 11.4.0] (/usr/bin/python3)
  jinja version = 3.0.3
  libyaml = True
```

**Note:**

- If you try to run ansible without any flags, you will get the usage message. However, to get a detailed view, use the command **ansible -h**
- It is possible to install Ansible using the Python package management “pip”. Ansible is written in Python.

## Exercise – 2: Running Ad-Hoc Commands

1. We will create a new inventory for this exercise. Create a new directory called **adhoc** and create a new file called **hosts**.
2. Edit the hosts file and create one group named **ubuntu** and add the first target **ubuntu\_desktop\_1** node 10.0.3.61

```
admin@orchestrator:~$ cd adhoc/
admin@orchestrator:~/adhoc$ vi hosts
admin@orchestrator:~/adhoc$ cat hosts
[ubuntu]
10.0.3.61
admin@orchestrator:~/adhoc$ _
```

3. Disable the SSH Key Checking for Ansible. Create a file **ansible.cfg** in the current directory.

```
admin@orchestrator:~/adhoc$ vi ansible.cfg
admin@orchestrator:~/adhoc$ cat ansible.cfg
[defaults]
host_key_checking = False
admin@orchestrator:~/adhoc$
```

4. Run the ping module to test connectivity to the target nodes using the following adhoc command:

```
ansible ubuntu -m ping -i hosts -u admin --ask-pass
```

```
admin@orchestrator:~/adhoc$ ansible ubuntu -m ping -i hosts -u admin --ask-pass
SSH password:
10.0.3.61 | SUCCESS => {
  "ansible_facts": {
    "discovered_interpreter_python": "/usr/bin/python3"
  },
  "changed": false,
  "ping": "pong"
}
```

- Notice that we provided the group of hosts that we would like to run this command against **ubuntu** and the module with **-m** flag and the flag **-i** to specify the **hosts** file where this group exists. We also had to provide ansible with the credentials using **-u** for the user name and **--ask-pass** to prompt for a password.

5. Change your hosts file and add the IP address of the second ubuntu target.

```
admin@orchestrator:~/adhoc$ cat hosts
[ubuntu]
10.0.3.61
10.0.3.62
```

6. Run the previous adhoc command and notice that it runs against all the hosts in the **ubuntu** group from our inventory file.

```
admin@orchestrator:~/adhoc$ ansible ubuntu -m ping -i hosts -u admin --ask-pass
SSH password:
10.0.3.61 | SUCCESS => {
  "ansible_facts": {
    "discovered_interpreter_python": "/usr/bin/python3"
  },
  "changed": false,
  "ping": "pong"
}
10.0.3.62 | SUCCESS => {
  "ansible_facts": {
    "discovered_interpreter_python": "/usr/bin/python3"
  },
  "changed": false,
  "ping": "pong"
}
```

### Exercise – 3: Writing the first Playbook

Ad-Hoc commands can be useful to run a quick test but they are not repeatable. In this exercise, we will write a simple playbook.

Providing variable can (and should) be provided directly in the inventory file. We will specify the variables using the format `[group_name:vars]`

1. Create a new directory called `playbooks` and a sub directory called `ping_playbook`.

```
administrator@orchestrator:~/playbooks/ping_playbook$ pwd
/home/administrator/playbooks/ping_playbook
```

2. Inside the current playbook directory `ping_playbook`, create a new `hosts` inventory file. We will add to our inventory the two Ubuntu targets however, we will now provide the variables needed to login to the remote nodes.

```
admin@orchestrator:~/adhoc$ cat hosts
[ubuntu]
10.0.3.61
10.0.3.62

[ubuntu:vars]
ansible_user=admin
ansible_ssh_pass=Op1q67323k
```

- We are adding the variable specifically to the Ubuntu group using the format `[group_name:vars]`.
3. In the same directory, create a simple playbook to use the ping module to test connectivity to both ubuntu servers (either use Tab or spaces not both).

```
admin@orchestrator:~/adhoc$ cat ping_playbook.yml
---
- name: ping module playbook
  hosts: ubuntu
  tasks:
    - name: ping ubuntu hosts
      ping:
        register: ping_output

    - name: view results from ping
      debug:
        msg: '{{ping_output}}'
```

- We are specifying the hosts as the group `ubuntu`. The first task will run the ping module against the hosts and register the output as a variable called `ping_output`. The second task will use the debug module to print a message containing the `ping_output` representing the results from the first task.

- To print the value on the `ping_output`, we must represent it as a variable using the format `'{{variable_name}}'`

4. Run the playbook and specify our inventory using the command below:

```
ansible-playbook -i hosts ping_playbook.yml
```

```
admin@orchestrator:~/adhoc$ ansible-playbook -i hosts ping_playbook.yml
PLAY [ping module playbook] *****
TASK [Gathering Facts] *****
ok: [10.0.3.61]
ok: [10.0.3.62]

TASK [ping ubuntu hosts] *****
ok: [10.0.3.62]
ok: [10.0.3.61]

TASK [view results from ping] *****
ok: [10.0.3.61] => {
  "msg": {
    "changed": false,
    "failed": false,
    "ping": "pong"
  }
}
ok: [10.0.3.62] => {
  "msg": {
    "changed": false,
    "failed": false,
    "ping": "pong"
  }
}

PLAY RECAP *****
10.0.3.61      : ok=3    changed=0    unreachable=0    failed=0    skipped=0    rescued=0    ignored=0
10.0.3.62      : ok=3    changed=0    unreachable=0    failed=0    skipped=0    rescued=0    ignored=0
```

**End of Lab 1**
